

Experiment 9

Aim: To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with containers.

Theory:

Docker is a popular platform that enables developers to build, package, and deploy applications as lightweight, portable, and self-sufficient containers. These containers encapsulate all the necessary dependencies and libraries required for an application to run, ensuring consistency across different environments. Here is a theoretical overview of

Docker:

Containerization:

Docker utilizes containerization technology to create isolated environments for applications. Containers are lightweight, standalone, and executable packages that include everything needed to run an application, such as code, runtime, system tools, libraries, and settings. This isolation ensures that applications run consistently across different environments, from development to production.

Docker Engine:

At the core of Docker is the Docker Engine, which is responsible for building, running, and managing containers. It consists of the Docker daemon, which manages containers, images, networks, and volumes, and the Docker client, which allows users to interact with the daemon through the Docker API.

Docker Images:

Docker images are read-only templates used to create containers. They contain the application code, runtime, libraries, dependencies, and other files needed to run the application. Images are built using Dockerfiles, which are text files that define the steps needed to create the image.

Docker Containers:

Containers are instances of Docker images that are running as isolated processes on a host machine. They are lightweight, portable, and can be easily started, stopped, moved, and deleted. Containers provide a consistent environment for applications to run, regardless of the underlying infrastructure.

Benefits of Docker:

Portability: Docker containers can run on any platform that supports Docker, making it easy to deploy applications across different environments.

Efficiency: Containers share the host OS kernel, reducing overhead and improving resource utilization.

Isolation: Containers provide a level of isolation that helps prevent conflicts between applications and dependencies.

Scalability: Docker enables easy scaling of applications by quickly spinning up additional containers.

Consistency: Docker ensures that applications run the same way in development, testing, and production environments.

```
C:\Users\Lenovo>docker --help

Usage:  docker [OPTIONS] COMMAND

A self-sufficient runtime for containers

Common Commands:
  run       Create and run a new container from an image
  exec      Execute a command in a running container
  ps        List containers
  build     Build an image from a Dockerfile
  pull      Download an image from a registry
  push      Upload an image to a registry
  images    List images
  login     Log in to a registry
  logout    Log out from a registry
  search    Search Docker Hub for images
  version   Show the Docker version information
  info      Display system-wide information

Management Commands:
  builder   Manage builds
  buildx*   Docker Buildx (Docker Inc., v0.12.1-desktop.4)
  compose*  Docker Compose (Docker Inc., v2.24.6-desktop.1)
  container Manage containers
  context   Manage contexts
  debug*    Get a shell into any image or container. (Docker Inc., 0.0.24)
  dev*      Docker Dev Environments (Docker Inc., v0.1.0)
  extension* Manages Docker extensions (Docker Inc., v0.2.22)
  feedback* Provide feedback, right in your terminal! (Docker Inc., v1.0.4)
  image     Manage images
  init*     Creates Docker-related starter files for your project (Docker Inc., v1.0.1)
  manifest  Manage Docker image manifests and manifest lists
  network   Manage networks
  plugin    Manage plugins
  sbom*     View the packaged-based Software Bill Of Materials (SBOM) for an image (Anchore Inc., 0.6.0)
  scout*    Docker Scout (Docker Inc., v1.5.0)
  system    Manage Docker
  trust     Manage trust on Docker images
  volume    Manage volumes

C:\Users\Lenovo>docker --version
Docker version 25.0.3, build 4deb4f41

C:\Users\Lenovo>

C:\Users\Lenovo>docker search ubuntu
